

User Guide — Aguilar Server Monitor Pro

For anyone logging in day-to-day to check on the server.

Logging in

Go to your instance's address (given to you by whoever launched it) and sign in with your username and password. If you don't have credentials yet, ask your administrator — see the Administrator Guide for how they retrieve or reset them.

The Dashboard

After login you land on the Dashboard, which shows:

- **CPU Usage** — current load as a percentage, plus 1/5/15-minute load average
- **Memory Usage** — percentage used, and used/total in MB
- **Disk Usage** — percentage used, and used/total in GB for the primary volume
- **Uptime** — time since the server last rebooted
- **System Information** — hostname, OS, kernel version, timezone, current time, and both public and private IP addresses
- **Running Services** — live status badges for Nginx, PM2, and SQLite

The dashboard refreshes itself automatically every 30 seconds — you don't need to reload the page.

Settings

From the top navigation, open **Settings** to change your password. You'll need your current password plus a new one (minimum 10 characters).

About

The **About** page shows the installed product version and support contact information.

Signing out

Click **Log Out** in the top navigation from any page.

If you see “Subscription Required”

This means the AWS Marketplace contract for this instance isn't currently active. This isn't something you can fix by logging in again — contact whoever manages billing/subscriptions for this instance, or reach out to support (see the About page for the contact email).
